

SampleAI — Security Overview

Last reviewed: December 2025.

Encryption

All customer data is encrypted at rest using AES-256 and in transit using TLS 1.2 or higher. Encryption keys are managed through AWS KMS with annual rotation.

Access Control

SampleAI provides role-based access control with four predefined roles (Owner, Admin, Member, Viewer) and supports custom role definitions on the Enterprise tier. Single sign-on is available via SAML 2.0 and OIDC, and multi-factor authentication can be enforced organization-wide by administrators.

Security Testing

We engage an independent security firm to perform penetration testing of the SampleAI platform annually. Summary reports are available to customers under NDA. We also run continuous automated vulnerability scanning against our production infrastructure.

Compliance and Attestations

SampleAI maintains a SOC 2 Type II attestation covering the Security and Availability trust services criteria. The most recent report covers the period ending September 2025 and is available to customers and prospects under NDA.

Incident Response

SampleAI maintains a documented incident response plan. In the event of a confirmed security incident affecting customer data, we will notify affected customers without undue delay and in any case within 72 hours of confirming the incident.

Audit Logging

Administrative actions and assistant activity — including summaries generated, messages posted, and tasks created — are recorded in an audit log retained for 12 months. Enterprise customers can export audit logs via API.
